**PRIORITY DOCUMENT**  
 SUBMITTED OR TRANSMITTED IN  
 COMPLIANCE WITH  
 RULE 17.1(a) OR (b)

REC'D 12 SEP 2000

WIPO

PCT

I, the undersigned, being an officer duly authorised in accordance with Section 74(1) and (4) of the Deregulation & Contracting Out Act 1994, to sign and issue certificates on behalf of the Comptroller-General, hereby certify that annexed hereto is a true copy of the documents as originally filed in connection with the patent application identified therein.

In accordance with the Patents (Companies Re-registration) Rules 1982, if a company named in this certificate and any accompanying documents has re-registered under the Companies Act 1980 with the same name as that with which it was registered immediately before re-registration save for the substitution as, or inclusion as, the last part of the name of the words "public limited company" or their equivalents in Welsh, references to the name of the company in this certificate and any accompanying documents shall be treated as references to the name with which it is so re-registered.

In accordance with the rules, the words "public limited company" may be replaced by p.l.c., plc, P.L.C. or PLC.

Re-registration under the Companies Act does not constitute a new legal entity but merely subjects the company to certain additional company law rules.

Warning

After an application for a patent has been filed, the Comptroller of the Patent Office will consider whether publication or communication of the invention should be prohibited or restricted under Section 22 of the Patents Act 1977. You will be informed if it is necessary to prohibit or restrict your invention in this way. Furthermore, if you live in the United Kingdom, Section 23 of the Patents Act 1977 stops you from applying for a patent abroad without first getting written permission from the Patent Office unless an application has been filed at least 6 weeks beforehand in the United Kingdom for a patent for the same invention and either no direction prohibiting publication or communication has been given, or any such direction has been revoked.

Notes

- If you need help to fill in this form or you have any questions, please contact the Patent Office on 0645 500505.
- Write your answers in capital letters using black ink or you may type them.
- If there is not enough space for all the relevant details on any part of this form, please continue on a separate sheet of paper and write "see continuation sheet" in the relevant part(s). Any continuation sheet should be attached to this form.
- If you have answered 'Yes' Patents Form 7/77 will need to be filed.
- Once you have filled in the form you must remember to sign and date it.
- For details of the fee and ways to pay please contact the Patent Office.

## BATTERY CASING

This invention relates to a battery casing, and in particular to a valve regulated lead acid battery casing.

During the operation of a lead acid battery, gases including hydrogen are expelled from the cell or cells. There is thus the danger of an explosive mixture of expelled hydrogen and oxygen in the air being formed near the battery. Further, the expelled gases may carry acid vapour or even droplets and there is the possibility of corrosion of metals outside the battery occurring.

It is an object of the present invention to provide a battery casing which prevents or reduces the effects of the above disadvantages.

In accordance with the invention a battery casing comprises a lid having a top surface and a recess inset into the said top surface, a vent at the base of the recess through which gas is expelled from the battery, a cover for sealingly covering the recess, a gas collection space being defined within the covered recess, and a guide means for guiding gas from the collection space away from the battery, wherein the cover may be positioned in more than one orientation.

Preferably a plurality of vents, e g one for each cell, is provided at the base of the recess.

Preferably the top surface of the cover lies no higher than the adjacent surface of the battery.

The guide means may comprise a nozzle protruding from the cover and to which a flexible tube may be attached.

One embodiment of the invention will now be described by way of example only, with reference to the accompanying drawings of which:

Figure 1 is a perspective view of a battery having a casing according to the invention;

Figure 2 is a plan view of the battery shown in Figure 1 on an enlarged scale;

Figure 3 is a cross-section on line III-III of Figure 2;

Figure 4 is a cross-section on line IV-IV of Figure 2;

Figure 5 is a cross-section on line V-V of Figure 2;

Figure 6 is a plan view of the battery shown in Figure 1 with the cover removed;

Figure 7 is a cross-section on line VII-VII of Figure 2; and

Figure 8 is an enlarged view of detail VIII of Figure 7.

The battery illustrated has a shape and dimensions particularly allowing its use in standard telecommunications racking, for example, in accordance with ETSI Standards.

As shown the battery having a casing 1 according to the invention comprises a rectangular box 2 having a lid 3 and two handles 4, 5 one at each end. The casing is made of moulded plastic material e g ABS. As viewed from the top (see Figure 1) the battery has two long sides and two short sides. A positive terminal 6 and a negative terminal 7 are positioned on the top surface and close to one of the short sides. As shown particularly in Figure 1, the terminals 6 and 7 are protected by box-like shields 9 and 10 respectively. The battery illustrated has six cells, so the casing is divided by internal walls 11, see Figures 3 and 4 particularly.

Inset into the upper surface of the lid 3, is an elongated recess 12 having two straight parallel sides 13, 14 and semi-circular end parts 15, 16. The recess is formed in the lid by a suitable moulding operation and the two straight parallel sides of the recess lie parallel to the two long sides of the battery. At the base of the recess are six vents 17, one for each cell, and two flame arrester supports 26, 27. The supports are located one adjacent each end part of the recess and each comprises an upstanding circular flange 28 with four regularly spaced-apart openings 29 (see Figures 6 and 8).

The periphery of the recess is defined by a vertical wall 18. Inwardly of the wall is an upstanding flange 19 having a height less than that of the wall over most of the wall length. The straight parts of the flange 19 are provided on its inner side with a plurality of triangular buttresses 55 to provide rigidity. A groove 21 is defined between the flange and the wall and a shoulder 20 is formed within the groove 21 adjacent the flange 19. Thus the groove 21 has a deep portion adjacent the wall 18 and a shallow portion adjacent the flange 19.

At the centre of both semi-circular end parts 15, 16 of the recess 2, the

wall 18 is interrupted by a semi-circular depression 22 (see Figure 8). Both depressions, one at each end of the recess as viewed in plan (see Figure 6) lead into semi-circular cross-sectional channels 23, 24 moulded into the lid. Each channel extends along the mid-line of the battery towards the two narrow ends of the lid respectively. One channel, 24, leads between the two terminals 6 and 7 and their associated shields 9 and 10.

A cover 25 of similar material to the casing 1, is moulded to fit tightly into the recess 12 in the lid 3. The level of the upper surfaces of the lid 3 and of the cover 25 lies below the level of the tops of the shields 9 and 10 when the cover is positioned in the recess. Thus, like the recess 12, the cover 25 has two straight sides 30, 31 and two semi-circular ends 32, 33. Around the periphery of the cover 25 is a cover flange 34, the outer surface 35 of which engages the wall 18 of the recess. The cover flange 34 is the same depth as the wall 18 so that the lower extremity 36 of the cover flange 34 fits into the deep part 18 of the groove 20 and the upper surface 37 of the cover 25 is level with the upper surface 38 of the lid 3. The level of the upper surfaces of the lid 3 and of the cover 12 lies below the tops of the shields 9 and 10 when the cover is positioned in the recess. The cover flange 34 has a shoulder 39 on its inner side and over most of its length. This shoulder 39 has an inner surface 40 which lies alongside the outer surface 41 of the flange 19 in the recess 25 on the lid 3. As can be seen particularly in Figures 3 and 4, a rectangular cross-sectional channel 42 is defined between the inner surface of the cover flange, above the shoulder 20 in the groove 21 in the recess 12, outwardly of the flange in the recess and below the shoulder on the lid. An 'O' ring seal (not shown in the drawings) is located within the channel 42 to provide an air-tight seal between the cover 25 and the recess 12. Optionally, the cover 25 may be removed from the recess and subsequently replaced.

At the centre of one semi-circular end part 32 (the left-hand end as shown in Figure 2) the cover 25 is formed with a horizontally-extending nozzle 43 for receiving the end of a flexible tube (not shown). An external enlargement 44 is provided adjacent the nozzle mouth 45 to provide a means to prevent the tube becoming detached. The nozzle mouth 45 lies in the channel 24 between the

terminals 6 and 7 and their associated shields 9 and 10 so that the tube passes between the terminals and associated shields. As can be seen in Figure 8 the nozzle has an internal tapered passage 46, the end of which terminates in a cylindrical recess 47 having a shoulder 48 adjacent the upper part thereof. A flame arrester 49 comprising a porous polyethylene or ceramic disc 49 seats within the recess 47 on the shoulder 48 so that a small gap 50 is provided between the arrester 49 and the upper part of the recess 51. The flame arrester 49 is a push fit in the recess 47 and is also held in position on the upper edges 52 of the four parts of the circular flange 28 of the arrester support.

In use, gas escapes from the cells of the battery through the valves and collects in the recess under the cover. As pressure increases the gas passes through the flame arrester, through the small gap, along the nozzle passage and then through the tube to a safe location away from the battery. If the battery is positioned on racking with the terminals near the front thereof, the tube will also project from the front.

In the embodiment illustrated the cover may be positioned in the lid recess the opposite way round i.e. with the nozzle at the right-hand side as shown in Figure 2, thus giving the user a choice of operation. The tube attached to the nozzle in this position will thus pass across the short side of the battery further from that where the terminals are located. Thus if the terminals are located at the front of standard racking, the gases escaping from the cells through the flame arrester are led away to the rear of the racking. This may be advantageous.

## CLAIMS:

- 1 A battery casing comprising a lid having a top surface and a recess inset into the said top surface, a vent at the base of the recess through which gas is expelled from the battery, a cover for sealingly covering said recess, a gas collection space being defined within the covered recess, and a guide means for guiding gas from the collection space away from the battery, wherein the cover may be positioned in more than one orientation.
- 2 A battery casing according to Claim 1, comprising a plurality of vents at the base of the recess, one for each of the battery cells.
- 3 A battery casing according to either one of the preceding claims, wherein the top surface of the cover lies no higher than the adjacent surface of the battery.
- 4 A battery casing according to any one of the preceding claims wherein the guide means comprises a nozzle protruding from the cover and to which a flexible tube may be attached.
- 5 A battery casing according to Claim 4, wherein the lid has a channel extending from the recess in which the guide means is located.
6. A battery casing according to Claim 5, wherein the lid has a plurality of channels extending from the recess in at least one of which the guide means is located.
- 7 A battery casing according to any one of the preceding claims, wherein the cover is removable from the lid.
- 8 A battery casing according to any one of the preceding claims wherein the cover and the lid each has two straight parallel sides and two semi-circular ends, the guide means being located in the middle of one semi-circular end of the lid.
- 9 A battery casing substantially as described herein with reference to and as illustrated in the accompanying drawings.
